Tiger Lake UP3 DDR4 SODIMM Reference Validation Platform

Customer Reference Board Schematics

Revision 1.0

December 2019

Intel Confidential

Document Number: 609003

You may not use or facilitate the use of this document in connection with any infringement or other legal analysis concerning Intel products described herein. You agree to grant Intel a non-exclusive, royalty-free license to any patent claim thereafter drafted which includes subject matter disclosed herein.

No license (express or implied, by estoppel or otherwise) to any intellectual property rights is granted by this document.

Intel technologies' features and benefits depend on system configuration and may require enabled hardware, software or service activation. Performance varies depending on system configuration. No computer system can be absolutely secure. Check with your system manufacturer or retailer or learn more at intel.com.

Intel technologies may require enabled hardware, specific software, or services activation. Check with your system manufacturer or retailer.

The products described may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Intel disclaims all express and implied warranties, including without limitation, the implied warranties of merchantability, fitness for a particular purpose, and non-infringement, as well as any warranty arising from course of performance, course of dealing, or usage in trade.

All information provided here is subject to change without notice. Contact your Intel representative to obtain the latest Intel product specifications and roadmaps.

Copies of documents which have an order number and are referenced in this document may be obtained by calling 1-800-548-4725 or visit www.intel.com/design/literature.htm.

Revision History

Document Number	Revision Number	Description	Revision Date
609003	0.5	• Initial Draft Release	January 2019
	0.7	• Added Power Meter Circuits. **NOTE:** Refer to PDG for PDBOM recommendation. The PDBOM provided in this design is specific to the RVP Implementation.	February 2019
	0.71	• Updated SoC Symbol file: — Sub-parts 2 and 3 are updated for alignment. — Sub-part 8 updated for latest ball-map specification (Rev 0.7).	March 2019
	0.8	• Updated SoC symbol file. • Replaced R3G68 resistor by 4.7K PU. • Replaced R6W9 resistor by 4.7K PU. • Changed R7U4 to 68.1K. • R8G15 stuffed.	July 2019
	1.0	• Updated SoC symbol to Rev 1.6.	December 2019

NOTE: Refer to Tiger Lake UP3 Platform Symbol (# 615721) for latest TGL UP3 symbol updates.

TGL UP3 DDR4 SODIMM RVP

REV:- 1P0

NOTES:

1. THIS SCHEMATIC DOCUMENTS THE GENERIC PRODUCT WITH ALL POSSIBLE CONFIGURATIONS.
   PLEASE REFER TO SPECIFIC PRODUCT PBA EPL FOR ITEMS SHOWN AS OPTIONAL IN THE SCHEMATIC.
2. RESISTORS ARE IN OHMS UNLESS OTHERWISE SPECIFIED.
3. VCC = +5V UNLESS OTHERWISE SPECIFIED.
4. * SUFFIX INDICATES ACTIVE LOW SIGNAL.
5. \I SUFFIX INDICATES SIGNAL EXITS HIERARCHICAL BLOCK.
6. THIS DOCUMENT ALSO EXISTS ON ELECTRONIC MEDIA.

CPU SIDEBAND SIGNALS

2 Error and Thermal Protection Signals

Signal Name	Description	Dir.	Buffer Type	Link Type	Availability
CATERR#	**Catastrophic Error:** This signal indicates that the system has experienced a catastrophic error and cannot continue to operate. The processor will set this signal for non-recoverable machine check errors or other unrecoverable internal errors. CATERR# is used for signaling the following types of errors: Legacy MCERRs, CATERR# is asserted for 16 BCLKs. Legacy IERRs, CATERR# remains asserted until warm or cold reset.	O	OD	SE	All Processor Lines

Voltage Margining

Voltage margining allows bypass VRs to reduce their voltages depending on S0i3.x states. To enable this feature, VNN_CTRL and V1P05_CTRL GPIO pins should be configured. This feature can reduce power in S0ix states.

DESIGN NOTE:

FPS FROM FPC COMPANY WILL BE SUPPORTED ON ERB

CAD NOTE:

TO BE PLACED ON BOTTOM SIDE OF THE BOARD EXACTLY BELOW J13101

NOTE: ALL THE GPIOS AND SPI LINES ARE PULLED UP TO +V1.8S_3.3S_FPS; AIC SHOULD USE THE SAME SUPPLY FOR SENSOR I/O

CAD NOTE:

THIS NEEDS TO BE AN EDGE CONNECTOR ON THE TOP OF RVP

DESIGN NOTE:

FPS FROM SYNAPTICS COMPANY WILL BE SUPPORTED ON ERB AND CRB

NOTE: CONNECTIONS NEED TO BE FINALIZED. WAITING FOR THE PINOUT FROM SYNAPTICS

[PAGE_TITLE=FPS CONNECTOR]

Name	Type	Description
VCCST_OVERRIDE	O	**VccST Override**: Signal that allows the PCH to keep VCCST powered ON (in case VCCST is powered down) for USB-C wake capability (connected to VCCSTPWRGOOD_TCSS on board). Signal will stay high when plug-in device on USB Type-C Subsystem port and signal will stay low when no device is connected.

MODULE REV DETAILS		
MODULE NAME	REV	DATE

+VCCSTG RAIL GENERATION

Name	Type	Description
GPP_H18 / **CPU_C10_GATE#**	O	**External Power Gate**: Control for VCCIO, VCCSTG and VCCPLL_OC during C10. When asserted, VCCIO, VCCSTG and VCCPLL_OC can be 0 V, however the power good indicators for these rails must remain asserted.

VCCSTPWRGOOD_TCSS	**VCCSTPWRGOOD_TCSS:** The processor requires this input signal to be asserted when the type-c subsystem requires keeping VCCST supply on (VCCST_OVERRIDE), even when entering S3/ S4– S5 states. This signal start as low and may change polarity only at the entry to S3/ S4– S5. If required to toggle, the signal level must always change before the de-assertion of VCCST_PWRGD signal at the Sx entry flow. This signal must have a valid level during S0 – S5 power states. S3 state is available only on H SKU.	I	CMOS	SE	UP3/UP4/H Processor Lines

The final enable signal for VCCST is logical OR of SLP_S3# (or SLP_S4#), VCCST_OVRD, and debug port connector (optional for debug). Refer to Power Sequencing Timing Diagrams Legacy Signals on page 441 for more information.

VCCSTG and Discharge Requirements

VCCSTG is a gated power rail derived from VCC1P05_OUT_FET. The final enable signal for VCCSTG is logical OR of CPU_C10_GATE#, VCCST_OVRD, and debug port connector (optional for debug). Refer to Power Sequencing Timing Diagrams Legacy Signals on page 441 for more information.

As long as VccST and VccSTG are power gated separately, the following requirements are critical to prevent system failure on Tiger Lake:

1. VccSTG should have a discharge circuit, either integrated into its load switch or externally on the motherboard. The recommended nominal $R_{discharge}$ <= 300 Ohms to GND. The discharge circuit should be activated when the VccSTG load switch is disabled.

POWER SEQUENCING LOGIC - PAGE I

DESIGN NOTE:

DO NOT STUFF THE PD RES

Table 1. TPS3779, TPS3780 Truth Table

CONDITIONS	OUTPUT
SENSE1 < V_{IT-}	OUT1 = low
SENSE2 < V_{IT-}	OUT2 = low
SENSE1 > V_{IT+}	OUT1 = high
SENSE2 > V_{IT+}	OUT2 = high

V_{IT+}	Positive-going input threshold voltage	$V_{(SENSE)}$ rising			1.194	V
				−1%	1%	
V_{IT-}	Negative-going input threshold voltage	$V_{(SENSE)}$ falling	TPS37xxA (0.5% hysteresis)		1.188	V
			TPS37xxB (5% hysteresis)		1.134	V
			TPS37xxC (10% hysteresis)		1.074	V
			TPS37xxD (1% hysteresis)		1.182	V
		$V_{(SENSE)}$ falling		−1%	1%	

OUT1	5	2	O	OUT1 is the output for SENSE1. OUT1 is asserted (driven low) when the voltage at SENSE1 falls below V_{IT-}. OUT1 is deasserted (goes high) after SENSE1 rises higher than V_{IT+}. OUT1 is a push-pull output for the TPS3779 and an open-drain output for the TPS3780. The open-drain device (TPS3780) can be pulled up to 6.5 V independent of VDD; a pull-up resistor is required for this device.

DESIGN NOTE:

SENSE2 COMPARATOR IS NOT USED
